

el/ka/sy® - Your Kanban For All Suppliers

Efficient procurement of articles is critical for the success of an industrial company. Classic C-parts management systems of wholesalers, also called kanban systems, often only capable of managing a part of all kanban-capable articles. Consequently, further articles cannot be handled or only with high handling surcharges.

Often, suppliers and manufacturers with their own brands also do not want to deliver via third-party kanban systems. The result is that different processes are in use for kanban handling.

The solution is the intelligent procurement system el/ka/sy® that connects you with all your suppliers. Through maximum digitization and networking, you can focus again on the value-adding activities and thus expand your competitiveness.

Kanban can be so simple

YOUR ADVANTAGES

Manual activities such as handling Excel sheets, e-mail ping pong, pdf exchange and countless telephone calls as well as data intransparency, supplier dependency, high process and error costs are a thing of the past with el/ka/sy®. Automation levels of up to 100% and process cost reductions of up to 70% are the future. Data is collected only once and is automatically available at every relevant point.

Safe

el/ka/sy® ensures maximum safety in the process at all times. External influences such as noise and distractions are frequent sources of error. Therefore, at each process step, the user receives immediate feedback about the action he is currently performing. Double entries or accidental goods receipts are prevented by the system's logic.

Transparent

The el/ka/sy® IoT Hub is much more than a simple RFID reader. The operating panel enables warehouse staff to track the status of demands, open items and goods receipts at any time. At the same time, delivery dates of ordered goods can be called up in real time - time-consuming telephone calls with the purchasing department or inquiries with suppliers are now a thing of the past.

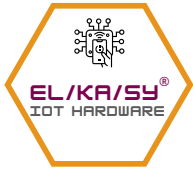

Integrated

el/ka/sy® integrates seamlessly into your existing system landscape. A transfer of demands and goods receipts into your system is easily possible due to the flexible interface. Keep an eye on the inventory management for C-parts as well as the current data from el/ka/sy® at any time in your ERP system. The flexibility of the system allows the implementation of many use cases, such as the transfer of forecast data to suppliers and much more.

Flexible

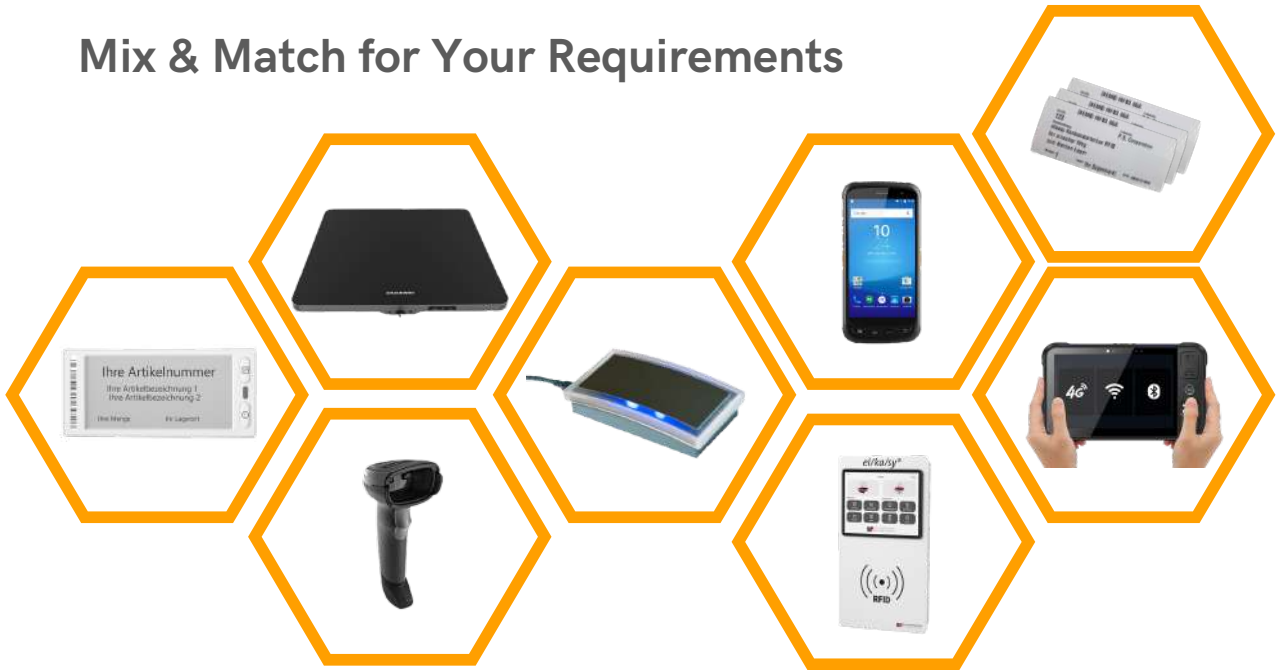

By means of the el/ka/sy® IoT tag, not only all load carriers can be equipped for kanban detection. The innovative RFID technology also makes it possible to make items that are not stored in small load carriers kanban-capable. With the el/ka/sy®-Dash Button and/or the el/ka/sy®-Requirement Card, large-volume B-parts, goods in original packaging, grid box goods, etc. can be procured in a lean and automated way.

EL/Ka/Sy® IOT HARDWARE

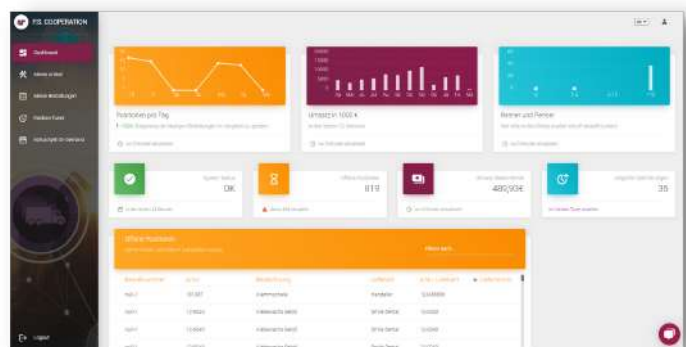

Our IoT hardware is as flexible as our Kanban system el/ka/sy®. You can adapt or compile it individually according to your requirements. No matter whether you want to record the requirements via RFID or barcode scanners, the IoT hub or e-labels. You have the full choice of hardware and use exactly what suits your needs and business processes. It is also possible using that is already established in your company.

Mix & Match for Your Requirements

KANBAN MANAGEMENT IN ONE PLATFORM

With el/ka/sy® you not only have the possibility to flexibly connect your workplaces from the warehouse to your suppliers, but you can also centrally process all items from C-parts and B-parts to spot and peak demands via one platform. Not only do you always have an overview of all articles, the delivery date and much more, but you can also exploit optimization potential.
